

# Software Requirements Specification (SRS) Document

## Locate a Socket Application

### 1. Introduction

#### 1.1 Overview

The Locate a Socket web application addresses the growing demand for charging infrastructure among electric vehicle (EV) drivers. It facilitates locating, navigating to, and making secure payments for EV charging stations along users' routes. By leveraging advanced location-based services and integrating various external systems, the application ensures a seamless and efficient experience for its users.

#### 1.2 Target Audience

This document is intended for the project's stakeholders, including software developers, system architects, business analysts, UI/UX designers, and project managers.

### 2. Purpose

#### 2.1 Primary Objective

The application aims to simplify the process of locating and utilizing EV charging stations, thereby enhancing convenience for drivers and encouraging EV adoption.

#### 2.2 Intended Benefits

- Efficiently locating nearby charging stations.
- Access to real-time charging station availability.
- Convenient navigation and payment solutions.
- Reduction in range anxiety, promoting EV usage.

### 3. Audience

#### 3.1 Target Users

The application serves the following groups:

- EV Drivers: Primary users searching for and utilizing charging stations.
- Charging Station Operators: Secondary users managing their station listings and availability.
- Administrators: System managers ensuring smooth operations and addressing user concerns.

### 4. Overall Description

## 4.1 Software Overview

The Locate a Socket application is a web-based platform that enables users to:

- Search for charging stations by location or proximity.
- View real-time availability and operational status.
- Navigate to the station using integrated maps.
- Make secure payments for charging services.

## 4.2 Operational Flow

- A driver inputs a location or uses GPS-based auto-location services.
- The system displays a list of nearby charging stations with relevant details.
- Users select a station, view its details, and receive navigation directions.
- After completing a session, users can make payments securely through the app.

## 5. External Interfaces

### 5.1 Map Services

Integration with Google Maps or similar APIs to provide route navigation and station locations.

### 5.2 Payment Gateways

Secure online payment systems such as PayPal, Stripe, or Apple Pay for processing transactions.

### 5.3 Charging Station APIs

Access real-time station data, including availability, pricing, and operational status, from third-party providers.

## 6. System Features

### 6.1 Key Features

- Station Search: Locate nearby charging stations using GPS or manual search.
- Availability Status: Real-time updates on station operational status and charger availability.
- Navigation Assistance: Detailed route guidance via maps.
- Secure Payments: Options for cashless and encrypted payment methods.
- Station Reviews: User reviews and ratings for stations to inform others.

## 7. Non-Functional Requirements

### 7.1 Performance

- System should provide search results within 2 seconds.
- Support at least 10,000 simultaneous users.

## 7.2 Security

- Secure Socket Layer (SSL) encryption for all data transmissions.
- PCI-DSS compliance for payment processing.

## 7.3 Reliability

- 99.9% uptime guarantee.
- Automatic failover and backup mechanisms.

## 7.4 Usability

- Intuitive user interface with minimal learning curve.
- Accessibility compliance (e.g., WCAG 2.1 standards).

## 8. Other Requirements

### 8.1 Compliance

- Adherence to energy sector regulations and EV standards.

### 8.2 Scalability

- Scalable architecture to support additional features such as reservations or integration with EV fleet systems.

### 8.3 Localization

- Multilingual support for global deployment.
